

Cplew Functional Specifications

My final project is a student assignment planner that allows users to plot upcoming assignments and track their work, using javascript and jquery to provide the data structure to update itself.

For my final project, the intended audience is basically any student with a need to get more organized. Both genders will be targeted, primarily college students of ages 18-20+.

A possible secondary audience would be high school students, again of both genders. Although the appearance would not necessarily be geared toward a younger audience.

As my project is not a “purchase” of sort, rather it will use cookies to store user data like assignments and tests, a returning user will be greeted by a custom “welcome” bar at the top, along with the pages being populated with their old data.
